

PRU and R-GPCD Calculation

September 22, 2020

This document contains suggested methods for estimating Percentage Residential Use (PRU), and explains how daily residential per capita water use (R-GPCD) is calculated by Water Board staff. As of October 1st, 2020, the R-GPCD is automatically calculated in the reporting tool. The methodology outlined here has not changed since the initial guidance was developed for the emergency conservation regulations.

When estimating PRU, we recommend using billing data to determine the volume of water provided to residential customers as a percentage of Total Monthly Potable Water Production. In cases where billing periods are not based on calendar month, the urban water supplier should use discretion in selecting the most comparable and appropriate billing period. PRU, rather than residential use volume, is requested in the monthly conservation report because it can be calculated using the previous year's data if current billing data is not available.

Example PRU Calculation: Using recent billing data to estimate PRU

Total Production (T): 1543.98 Acre-feet (AF)

Commercial Agriculture (C): 20 AF

Residential Use (R)¹: 1001.42 AF

1. Subtract Commercial Agriculture (if any) from Total Production

$$\text{Total Production, minus Agriculture (TPA)} = T - C$$

$$TPA = 1543.98 - 20 = 1523.98 \text{ AF}$$

2. Divide Residential Use by (Total Production – Commercial Agriculture)

$$PRU = \frac{R}{TPA} \times 100$$

$$PRU = \frac{1001.42}{1523.98} \times 100 = 65.71\%$$

If you do not have billing data for the current reporting month, use last year's data (**BOTH** residential use and total potable production) for the month that corresponds to the reporting month. For example, if you do not currently have October 2020 billing data available, use October 2019 data. **This calculated PRU using last year's data should be entered in the "Preliminary" column when submitting a report.**

¹ When estimating "Residential Use," we recommend using billing data to determine the volume of water provided to residential customers. In cases where billing periods are not based on calendar month, the urban water supplier should use discretion in selecting the most comparable and appropriate billing period.

PRU and R-GPCD Calculation

September 22, 2020

Once you have current billing data, re-calculate the PRU using current numbers and enter the new value in the “Final” column of the edited report.

Example PRU Calculation: Bi-Monthly Billing Cycle Initial Estimate

Total Production (T) Over Billing Cycle: 3002.15 AF

Commercial Agriculture (C) Over Billing Cycle: 35 AF

Residential Use (R) Over Billing Cycle: 1900.23 AF

Length of Billing Cycle: 61 days

Reporting Month: May

Days in May: 31 days

1. Subtract Commercial Agriculture (if any) from total production

$$\text{Total Production, minus Agriculture (TPA)} = T - C$$

$$TPA = 3002.15 - 35 = 2967.15 \text{ AF}$$

2. Calculate Residential Use for Reporting Month (RM) and Total Production for Reporting Month (TPM)

$$TPA \text{ for May (TPM)} = \frac{TPA \times \text{days in May}}{\text{days in billing cycle}}$$

$$TPM = \frac{2967.15 \times 31}{61} = 1507.90 \text{ AF}$$

$$R \text{ for May (RM)} = \frac{R \times \text{days in May}}{\text{days in billing cycle}}$$

$$RM = \frac{1900.23 \times 31}{61} = 965.69 \text{ AF}$$

3. Divide Residential Use for Reporting Month by (Total Production – Commercial Agriculture) for Reporting Month

$$PRU = \frac{RM}{TPM} \times 100$$

$$PRU = \frac{965.69}{1507.90} \times 100 = 64.04\%$$

Please note in the “Qualification” box that the billing data is bi-monthly. As with the previous PRU calculation example, if you do not have billing data that encompasses the current reporting month, please use billing data from the previous year to estimate PRU and enter the value in the “Preliminary” column.

PRU and R-GPCD Calculation

September 22, 2020

Example Residential Gallons Per Capita Daily (R-GPCD) Calculation

The updated reporting tool automatically calculates the monthly R-GPCD value. The calculation methodology is outlined below.

Original Units	Conversion Factor (CF) from Original Units to Gallons
Gallons (G)	1
Million Gallons (MG)	1000000
Hundred Cubic Feet (CCF)	748.052
Acre Feet (AF)	325851

Total Production (T): 1543.98 AF

Commercial Agriculture (C): 20 AF

Percentage Residential Use (PRU): 65.71%

Population (P): 69078 people

Month: May

Days in Month: 31 days

Conversion Factor (CF): 325851

1. Subtract Commercial Agriculture (if any) from Total Production

$$\text{Total Production, minus Agriculture (TPA)} = T - C$$

$$TPA = 1543.98 - 20 = 1523.98 \text{ AF}$$

2. Convert (Total Production-Commercial Agriculture) to Gallons, using the Conversion Factor

$$\text{TPA in Gallons (TG)} = TPA \times CF$$

$$TG = 1523.98 \times 325851 = 496590407 \text{ G}$$

3. Multiply the Total Production Gallons by Percentage Residential Use to get Residential Use in Gallons

$$\text{Residential Use in Gallons (RG)} = TG \times \frac{PRU}{100}$$

$$RG = 496590407 \times \frac{65.71}{100} = 326313708 \text{ G}$$

4. Divide Residential Use by (Population x Days in Month) to get R-GPCD

$$R - GPCD \text{ for May} = \frac{RG}{P \times \text{days in May}}$$

$$R - GPCD \text{ for May} = \frac{326313708}{69078 \times 31} = 152.38 \text{ GPCD}$$
